

Math Strategies We Use in 5th Grade

Strategy descriptions and illustrations from *Bridges in Mathematics* Grade 5 Teachers Guide, used with permission of The Math Learning Center for distribution to Newhall School District staff, students, and families. Other uses prohibited.

Strategies for Multiplying Whole Numbers & Unit Fractions

Use repeated addition.

$$5 \times \frac{1}{4} = \frac{1}{4} + \frac{1}{4} + \frac{1}{4} + \frac{1}{4} + \frac{1}{4} = \frac{5}{4} = 1 \frac{1}{4}$$

Make the problem easier by cutting it into chunks you know how to solve.

$$\frac{1}{4} \times 5 = \left(\frac{1}{4} \times 4\right) + \left(\frac{1}{4} \times 1\right) = 1 + \frac{1}{4} = 1 \frac{1}{4}$$

If the combination involves fourths, you can find half, and then cut the result in half again.

$$\frac{1}{2} \text{ of } 5 \text{ is } 2 \frac{1}{2} \text{ and } \frac{1}{2} \text{ of } 2 \frac{1}{2} \text{ is } 1 \frac{1}{4}$$

If the combination involves fourths, you can think about quarters.

$$5 \times \frac{1}{4} \text{ is the same as } 5 \text{ quarters, and } 5 \times 0.25 = 1.25$$

The Over Strategy

Multiply by a little too much and adjust

Examples:

$$199 \times 28 = (200 \times 28) - (1 \times 28)$$

$$98 \times 37 = (100 \times 37) - (2 \times 37)$$

Strategies for Adding & Subtracting Fractions

$\frac{2}{5} + \frac{1}{4}$

Think of Money

$$\frac{2}{5} + \frac{1}{4} = \$0.40 + \$0.25 = \$0.65$$

$$= \frac{65}{100} = \frac{13}{20}$$

Think of a Clock

$$\frac{2}{5} + \frac{1}{4} = \frac{24 \text{ minutes}}{60 \text{ minutes}} + \frac{15 \text{ minutes}}{60 \text{ minutes}} = \frac{39 \text{ minutes}}{60 \text{ minutes}}$$

$$= \frac{39}{60} = \frac{13}{20}$$

Double Number Line

What length can we divide by both 4 and 5?

Ratio Tables

$\frac{2}{5} \mid ?$	$\frac{1}{4} \mid ?$
$\frac{2}{5} \mid 20$	$\frac{1}{4} \mid 20$
$\times 4$	$\times 5$
$\frac{8}{5} \mid 20$	$\frac{5}{4} \mid 20$
$\times 5$	$\times 4$
$\frac{40}{20} \mid 20$	$\frac{20}{20} \mid 20$

$$\frac{2}{5} + \frac{1}{4} = \frac{8}{20} + \frac{5}{20} = \frac{13}{20}$$

This booklet will show you some of the strategies I have learned to be more successful at solving problems. As I become a stronger mathematician, I learn how and why problems can be solved in different ways. The more I learn and use these different strategies, the more efficient and accurate I will become.

<p>8 bars = \$10</p> <p>\$10 for 8 bars = \$1 each with \$2 left over</p> <p>\$2 divided by 8 bars ????</p> <p>25¢ 25¢</p> <p>25¢ 25¢</p> <p>4 quarters per dollar</p> <p>... so 1 extra quarter per bar</p> <p>So... 1 dollar and 1 quarter per bar</p> <p>1 bar = \$1.25</p>	<p>20 bars = \$23</p> <p>\$23 for 20 bars = \$1 each with \$3 left over</p> <p>\$3 divided by 20 bars ????</p> <p>5¢ 5¢ 5¢ 5¢ 5¢ 5¢ 5¢ 5¢</p> <p>5¢ 5¢ 5¢ 5¢ 5¢ 5¢ 5¢ 5¢</p> <p>20 nickels per dollar</p> <p>1 nickel per bar, per dollar... so 3 extra nickels per bar</p> <p>So... 1 dollar and 3 nickels per bar</p> <p>1 bar = \$1.15</p> <p>Best Buy!!!</p>
--	---

Addition & Subtraction

I use my understanding of the relationships between addition and subtraction and apply it to solving problems with fractions and decimals.

Fractions

I can use different strategies to make fractions with common

Money Model

$$\frac{3}{10} + \frac{7}{20} = \$0.30 + \$0.35 = \$0.65 = \frac{65}{100} = \frac{13 \text{ nickels}}{20 \text{ nickels}} = \frac{13}{20}$$

Clock Model

$$\frac{5}{6} + \frac{1}{12} = \frac{50 \text{ minutes}}{60 \text{ minutes}} + \frac{5 \text{ minutes}}{60 \text{ minutes}} = \frac{55 \text{ minutes}}{60 \text{ minutes}} = \frac{11 \text{ sets of 5 minutes}}{12 \text{ sets of 5 minutes}} = \frac{11}{12}$$

denomina-
order to add
subtract

tors in
and
them.

Double ber Line

Num-

Equivalent Fractions for $\frac{2}{3}$

numerator	2	4	8	16
denominator	3	6	12	24

Equivalent Fractions for $\frac{5}{8}$

numerator	5	10	15
denominator	8	16	24

$$\frac{2}{3} + \frac{5}{8} = \frac{16}{24} + \frac{15}{24} = \frac{31}{24} \text{ or } 1\frac{7}{24}$$

Here are some example of students using different strategies:

Partial Products strategy for solving multiplication combinations

Example:
 $33 \times 23 = (30 \times 23) + (3 \times 23)$
 $= 690 + 69$
 $= 759$ We split one of the factors to make 33×23 easier to solve.

	23	1	3	30	33
		23	69	690	759
30	$30 \times 23 = 690$				
	$3 \times 23 = 69$				

The Five is Half of 10 Strategy

Example:
 $5 \times 78 = \frac{1}{2} \times (10 \times 78)$
 $= \frac{1}{2} \times 780$
 $= 390$

OR $5 \times 78 = (10 \times 78) \div 2$
 $= 780 \div 2$
 $= 390$

The Fifty is Half of 100 Strategy

Example:
 $50 \times 78 = \frac{1}{2} \times (100 \times 78)$
 $= \frac{1}{2} \times 7,800$
 $= 3,900$

OR $50 \times 78 = (100 \times 78) \div 2$
 $= 7,800 \div 2$
 $= 3,900$

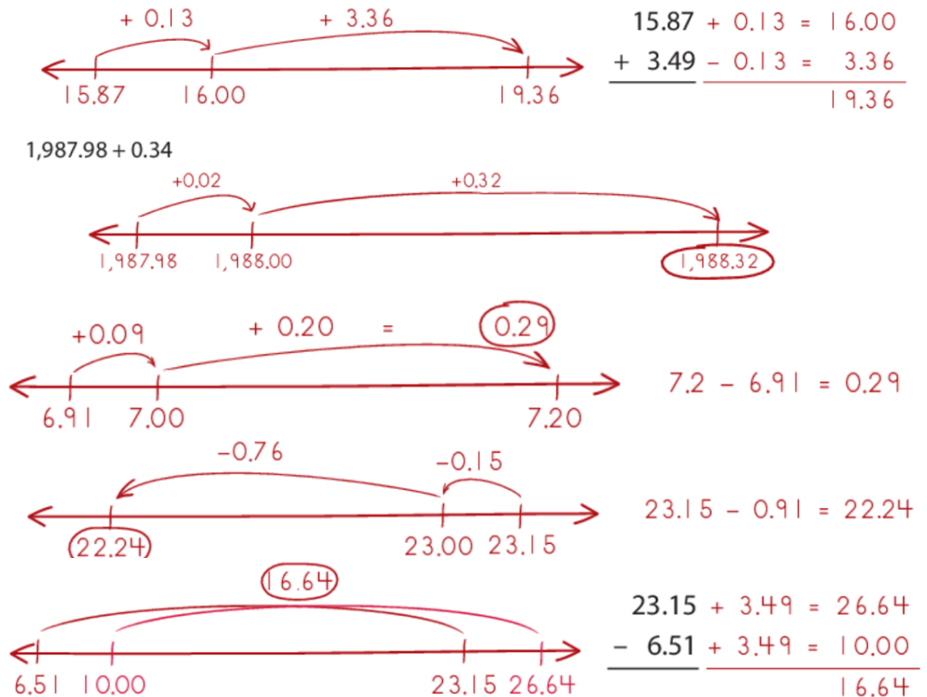

End of the Year Expectations

- Add and subtract fractions including mixed numbers with unlike denominators.
- Add and subtract decimals to the hundredths place.
- Multiply whole numbers using standard algorithm.
- Divide whole numbers with up to 4-digit dividends and 2-digit divisors using strategies.
- Multiply fraction and whole number by a fraction.
- Divide unit fractions ($\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$...) by whole numbers and whole numbers by unit fractions
- Multiply and divide decimals to the hundredths place.

Decimals

I use number lines and my understanding of place value to help me add and subtract decimals.

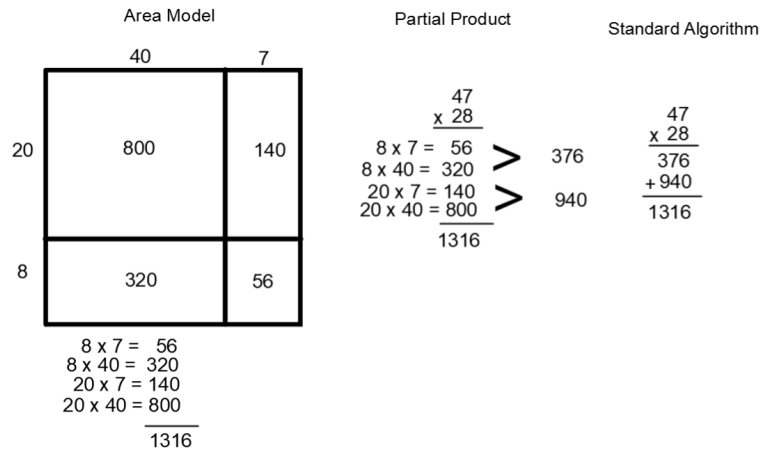

Fraction Decimal Relationships

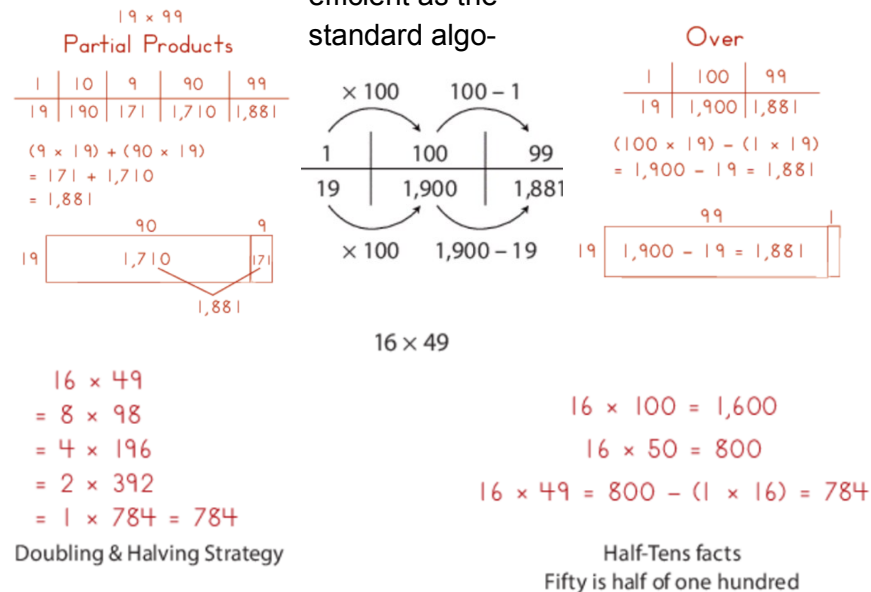

$\frac{1}{4} + \frac{1}{2} = \frac{3}{4}$	$\frac{1}{5} + \frac{1}{4} = \frac{9}{20}$	$\frac{3}{4} - \frac{2}{5} = \frac{7}{20}$
$0.25 + 0.50 = 0.75$	$0.20 + 0.25 = 0.45$	$0.75 - 0.40 = 0.35$

Multiplication

I can multiply whole numbers using strategies and the standard algorithm. I start by using the area model and then move toward the partial product strategy and finally I see the relationship to the standard algorithm.

Sometimes, I find that using a different strategy is just as efficient as the standard algo-

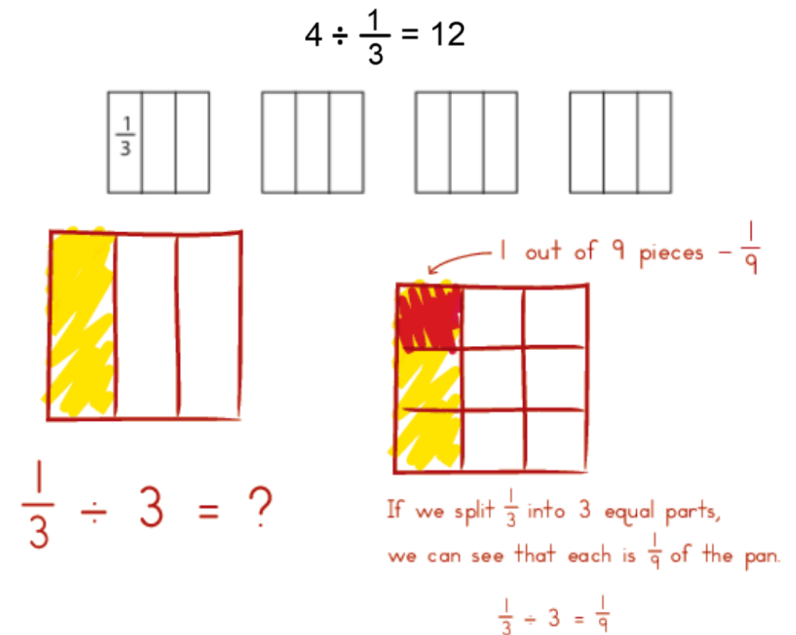

I use my understanding of division strategies to help me divide fractions.

Patterns

$$\begin{aligned} 8 \div 4 &= 2 \text{ people} \\ 8 \div 2 &= 4 \text{ people} \\ 8 \div 1 &= 8 \text{ people} \\ 8 \div \frac{1}{2} &= 16 \text{ people} \end{aligned}$$

Models

Partial Quotients

I can break up the dividend into smaller numbers to make the

$$161 \div 7$$

If you split 161 into 140 + 21, this problem is easier.

$$\begin{array}{r} 140 \div 7 = 20 \\ 21 \div 7 = 3 \\ \hline 161 \div 7 = 23 \\ (140 \div 7) + (21 \div 7) \\ 20 + 3 \end{array}$$

problem easier to follow.

Over Under

Overs $858 \div 78 = 11$

$$\begin{array}{r|l|l} 1 & 10 & 11 \\ \hline 78 & 780 & 858 \end{array} \quad \begin{array}{l} 10 \times 78 = 780 \\ + 1 \times 78 = 78 \\ \hline 11 \times 78 = 858 \end{array}$$

Unders $8,712 \div 88$

$$\begin{array}{r} 8,800 \div 88 = 100 \\ - 88 \\ \hline 8,712 \div 88 = 99 \end{array} \quad \begin{array}{r} 8,800 \\ - 88 \\ \hline 8,712 \div 88 = 99 \end{array}$$

I can solve a problem with a friendly number and then subtract or

It takes 352 cups of strawberries to make 88 fruit pizzas. How many cups of strawberries does it take to make 1 fruit pizza?

$$352 \div 88$$

$$\begin{array}{r|l|l|l|l|l} & \div 2 & \div 2 & \div 2 & \div 11 & \\ \hline \text{cups of strawberries} & 352 & 176 & 88 & 44 & 4 \\ \hline \text{fruit pizzas} & 88 & 44 & 22 & 11 & 1 \end{array}$$

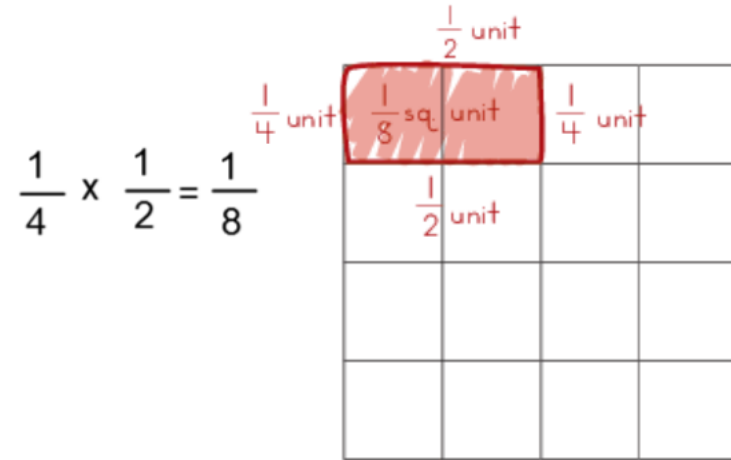

It takes 1 cup of grapes to make $\frac{1}{4}$ of a fruit pizza. How many cups of grapes does it take to make a whole fruit pizza?

$$1 \div \frac{1}{4}$$

$$\begin{array}{r|l|l} & \times 4 & \\ \hline \text{cups of grapes} & 1 & 4 \\ \hline \text{fruit pizzas} & \frac{1}{4} & 1 \end{array}$$

I use my understanding of multiplication strategies to help me multiply fractions.

Array

Area Model

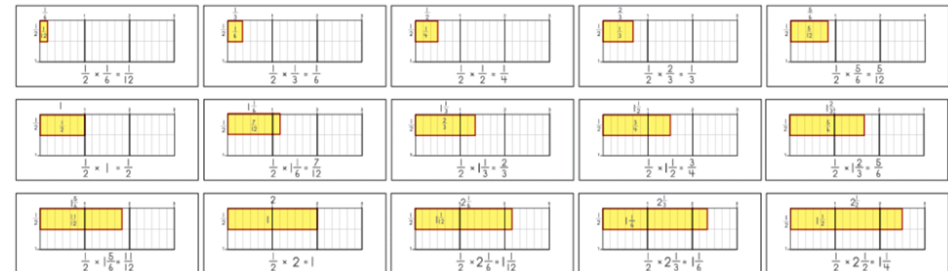

$$1 \frac{1}{4} \times 2 \frac{1}{4} = 2 \frac{13}{16}$$

$$2 + \frac{1}{2} + \frac{1}{4} + \frac{1}{16} = 2 \frac{13}{16}$$

$$2 \frac{1}{4} + \frac{9}{16} = 2 \frac{13}{16}$$

I use my understanding of multiplication strategies to help me multiply decimals.

$$\begin{array}{r} 1 \\ 3.0 \\ 0.6 \\ 1.5 \\ + 0.30 \\ \hline 5.40 \text{ sq. m} \end{array}$$

Area

Model

Partial

$$\begin{array}{r} 3.6 \\ \times 1.5 \\ \hline 1 \times 3 = 3 \\ 1 \times 0.6 = 0.6 \\ 0.5 \times 3 = 1.5 \\ 0.5 \times 0.6 = 0.30 \\ \hline 5.40 \text{ sq. m} \end{array}$$

Product

Standard Algorithm

$$\begin{array}{r} 3.6 \\ \times 1.5 \\ \hline 1.80 \\ 3.60 \\ \hline 5.40 \text{ sq. m} \end{array}$$

16 x 2.25 solved by doubling twice and then multiplying by 4

16 x 2.25 solved using the Half-Tens facts

Division

I use strategies and my understanding of the relationship between multiplication and division to solve division problems.

Multiplying to Divide

I can use a ratio table, an area model, and my understanding of multiplication and division to solve problems.

80 ÷ 16

300 ÷ 12

\$94.00 ÷ 8
